Report to MLIT on Investigation

Further to the instruction from the Ministry of Land, Infrastructure, Transport and Tourism (MLIT) regarding investigation of the actual emissions and fuel efficiency tests, Suzuki reported the result of investigation to the ministry today.

As the outcome of our internal investigation, acts of injustice, such as manipulation of fuel efficiency data were not found. Meanwhile, some discrepancies were found in the automobile emission and fuel efficiency testing process between the regulation by MLIT and the actual method carried out by Suzuki and therefore Suzuki herewith reports on the issue as follows. We would like to express our deep apologies to all our customers and stakeholders on this issue.

1. Measuring method different from regulations specified by the government.
   Suzuki reviewed the measuring process of driving resistance of all 16 models currently available for sale. It was found that instead of actually measured data of the car, the submitted driving resistance data at the time of application for certificate was a build-up of actually measured data of individual components such as tires, brakes and transmission from rolling resistance tests and air resistance tests in the wind tunnel and upon verification of adequateness compared with actually measured data of the car through coasting test.

2. Cause of the issue
   We consider the background lies in the fact that Sagara proving ground owned by us locates on top on a hill close to sea, where it is significantly affected by weather conditions such as influence of wind and carrying out tests were difficult.

   The recent improvements in fuel efficiency technology accompanied by reduced rolling resistance and vehicle weight have greater tendency for cars to be influenced by wind as well as results spread in wider variations. In case of adopting tires with less rolling resistance, for an example, it is difficult to perceive the effect without variation in data, and have to increase the number of tests.

3. Influence on fuel efficiency value
   In the course of the investigation, we measured actual data through coasting test in addition to the data already obtained by the time of application for certificate. As the result of
verification of all certified fuel efficiency value with these actual data through coasting test, all certified values remained within the range of measurement deviation.

Therefore, we consider it not necessary to amend the driving resistance value applied, nor the fuel efficiency value measured using the driving resistance value.

As for performance regarding emissions, it complies with the safety standards and we consider it does not have any problems.

Suzuki assures users to continue use of its products at ease.

4. 16 models subject to investigation

<Mini-vehicles>
Alto (Launched on 22nd December, 2014)
Alto Lapin (Launched on 3rd June, 2015)
Wagon R (Launched on 19th September, 2012)
Hustler (Launched on 8th January, 2014)
Spacia (Launched on 15th March, 2013)
Every (Launched on 18th February, 2015)
Carry (Launched on 20th September, 2013)
Jimny (Running change in 2010)

<Ordinary and large motor vehicles>
Solio (Launched on 26th August, 2015)
Ignis (Launched on 18th February, 2016)
Baleno (Launched on 9th March, 2016)
SX4 S-CROSS (Launched on 19th February, 2015)
Swift (Launched on 18th September, 2010)
Escudo 2.4 (Running change in 2012)
Escudo (Launched on 15th October, 2015)
Jimny Sierra (Running change in 2010)

The above issues do not apply to products sold under Suzuki badge outside Japan. Suzuki assumes that the fact would not have any impact on forecasts for the consolidated operating results at the moment. If any matters occur in the future that require modifications to the consolidated earnings forecasts, such matter shall be promptly disclosed
